

NC Constant Wattage Heater Cable

FM:

- Class I, Division 2, Groups B, C, D
- Class II, Division 2, Groups F, G
- Class III, Division 2

Application

- Nelson Type NC constant wattage heater cable is ideal for use in maintaining fluid flow under low ambient conditions.
- Freeze protection and process temperature maintenance systems such as product pipelines, process water, dust suppression systems, lube oil and condensate return are typical applications for this product.
- The base product is supplied with a tinned copper metal braid that may be used in both general applications and in dry, non-corrosive hazardous (classified) areas.
- It is also used to provide a conductive ground path when cable is installed on nonconductive surfaces, such as plastic or painted pipe.

Features

- Nelson Type NC constant wattage heater cable is a parallel resistance electric heater strip.
- A fluoropolymer sheath material is extruded over the two multi-stranded, nickel-plated, 12-gauge copper bus wires.
- The nichrome heating element is spirally applied around parallel construction and in contact with the bus wires at specific intervals known as zones.
- A fluoropolymer over jacket is then extruded over the construction to provide dielectric strength, moisture resistance, and for protection from impact and abrasion damage.
- A stranded tinned copper metal braid is supplied on all heaters.
- An optional stainless steel braid is available for mechanical abuse situations.
- An optional fluoropolymer over jacket can be specified when the heater cable is to be installed in wet or corrosive environments.
- Nelson Heat Tracing Systems products are supplied with a limited warranty.

Operating Principle

- The parallel bus wires supply voltage along the entire length of the heater cable.
- A resistance wire heating element is spirally wrapped around bus wires contacting alternate bus wires at specific intervals forming heating zones.
- This series of parallel heating zones provides a constant power output for each zone, irrespective of where the cable is cut along the length of the bus wires.
- Each cable construction has the heating zone resistance sized to provide multiple power ratings when used on different voltages.
- This variation is accomplished using different spiral wrap spacing and heater zone lengths.
- There is no change of power output as the temperature changes, giving a steady power output anywhere in its recommended operating range.

Options

- Connection Kits for Power Connection, Tee Splice, Splices and End Seals (Nelson PLT Series)
- Thermostatic Controls (Nelson TA, TH, TE and HC Series)
- Junction Boxes, Tapes and Warning Signs
- Custom Control, Monitoring and Power Panels

Certifications and Compliances

- FM Approved: JI 1N0A8.AF
- Other Standards: IEEE 515-2004, IEEE 515.1-2005

NOTES:

1. Circuit breakers are sized per article NFPA 70, National Electrical Code..
2. When using 2 or more heater cables of different wattage ratings in parallel on a single circuit breaker, use the 15A column amperage of 15 amps, divide it by the maximum footage to arrive at an amps/foot figure for each cable. You can then calculate circuit breaker sizes for these combination loads. These amps/foot factors include the NEC sizing factor in Article 427-4.
3. Heater cables with CB optional constructions contain a metal ground shield as required by Article 427-23 of the NEC.
4. Article 427-22 of the NEC requires ground fault equipment protection for each branch circuit supplying electric heating equipment. Exceptions to this requirement can be found in NFPA 70, National Electrical Code.
